From the graph, it is clearly revealed that more men and women were studying part-time as compared to full-time for the given period of time. If we talk about the initial segment of time that is in 1970 and 1971 about thousand (1000) male were in part-time further education and this number decreased to 850 thousand in the time period of 1980 and 1990.

In <sup>to</sup> contrast to it, number of full-time students increased over the time but still this number was many times lower than the number of people in part time further education.

X In 1972, nearly <sup>100-</sup>thousand people were in ~~part~~ full time education and this number increased to 200-thousand in the next

20 years.

If we talk about the females who were engaged in part-time education, there were 700-thousand females in the time period of 1970 who were engaged in part-time education and this number increased to 1100-thousand in the time-period of 1990/1991 and this was even higher than the number of males who were in part-time education in this year.

In summary, females were more in number than their male counterparts with respect to their participation in part-time and full-time education in Britain for that given period of time.
